The figure displays a scatter plot of data points in a 2D space. The data is divided into two classes: one represented by blue 'x' marks and the other by orange 'x' marks. A horizontal line, likely a decision boundary, is drawn across the plot. Several vertical line segments are present, indicating regions where the model's prediction is uncertain or where misclassification occurs. The plot shows a complex distribution of points, with some regions having a high density of points from one class and others having a mix of both.

The figure is a scatter plot with a horizontal axis and a vertical axis. A solid blue horizontal line is drawn across the plot at the y=0 level. Data points are represented by 'x' marks. There are two main groups of data points: blue and orange. The blue 'x' marks are distributed across the plot, with a higher density below the zero line. The orange 'x' marks are more concentrated above the zero line. Several horizontal black bars are drawn above the data points, indicating the range of values for different subsets of the data. The overall distribution suggests a difference in the central tendency or spread between the two groups.

Figure 1 is a scatter plot showing the distribution of the number of nodes in the largest component of a network. The x-axis represents the number of nodes (0 to 1000), and the y-axis represents the frequency (0 to 100). The data is divided into two groups: blue 'x' marks for the 'Control' group and orange 'x' marks for the 'Intervention' group. A horizontal blue line is drawn at y=50. Several horizontal black bars are placed above the data points, indicating specific frequency ranges for each group.

55,679,878

6285633005_R03C01 - EGFR

The figure is a scatter plot with 'Days since start of outbreak' on the x-axis (0 to 150) and an unlabeled y-axis. It displays three data series: Blue (n=100), Orange (n=100), and Grey (n=100). The Blue series shows a positive correlation, while the Orange and Grey series show negative correlations. A horizontal line is at y=0, and a vertical line is at x=100. The legend in the top right corner identifies the series and provides their respective sample sizes.

The figure is a scatter plot with a horizontal axis. Data points are represented by 'x' marks, colored blue and orange. A thick horizontal line is drawn across the plot, likely representing a mean or median. Several vertical line segments are present, possibly indicating confidence intervals or specific data ranges. The blue points are generally clustered below the horizontal line, while the orange points are generally clustered above it, though there is significant overlap between the two groups.

The figure displays a scatter plot with data points represented by 'x' marks. The points are colored in three distinct groups: blue, grey, and orange. A solid horizontal blue line is drawn across the plot, likely representing a mean or median. Several horizontal black line segments are positioned below the blue line, spanning different ranges of the x-axis. The data points are distributed across the plot, with some clusters and outliers.

55,679,878

A scatter plot showing the relationship between $\log_{10}(\Delta T)$ (y-axis) and $\log_{10}(\Delta T_{\max})$ (x-axis) for 1000 stars. The x-axis ranges from -1 to 1, and the y-axis ranges from -1 to 1. A horizontal line is drawn at $y = 1$. The data points are categorized by color: blue, orange, and grey. The plot shows a dense distribution of points, with a significant number of points falling below the $y = 1$ line. Horizontal black bars are present at $y = 1$ for various ranges of $\log_{10}(\Delta T_{\max})$.

The figure is a scatter plot with a white background and a black border. It displays two sets of data points, each represented by 'x' marks. One set of points is colored blue, and the other is colored orange. The points are distributed across the plot area, with some overlap between the two groups. A solid horizontal blue line runs across the middle of the plot, likely representing the mean or median of the combined data. Several horizontal black line segments are positioned above and below the blue line, indicating statistical measures such as the standard deviation or confidence intervals for each group. The overall layout is clean and professional, typical of a scientific or statistical report.

A Manhattan plot showing the results of a genome-wide association study (GWAS) on chromosome 7. The y-axis represents the negative logarithm of the p-value ($-\log_{10}(p\text{-value})$), ranging from 0 to 14. The x-axis represents the genomic position in base pairs, ranging from 54,679,879 to 55,679,878. A horizontal blue line is drawn at $y=7$, indicating a significance threshold. Data points are colored red (top), green (middle), and blue (bottom). Several points are highlighted with black horizontal bars, indicating regions of interest or significant associations.

Figure 1 is a scatter plot showing the distribution of the number of nodes in the largest component of a network. The x-axis represents the number of nodes (0 to 100), and the y-axis represents the frequency (0 to 100). The data is divided into two groups: blue 'x' marks for the 'Control' group and orange 'x' marks for the 'Intervention' group. A horizontal line is drawn at y=50. Several horizontal arrows indicate shifts in the distribution for the intervention group compared to the control group.

The figure is a scatter plot with 'Number of individuals' on the x-axis (0 to 100) and 'Number of species' on the y-axis (0 to 10). The plot contains numerous data points marked with 'x's in blue, orange, and grey. A solid blue line indicates a linear regression fit, showing a positive correlation. Several black horizontal line segments are drawn at different species counts, likely representing specific thresholds or intervals.

Scatter plot showing the relationship between $-\log_{10}(p\text{-value})$ (Y-axis) and $\log_{10}(\text{FC})$ (X-axis) for 1000 genes. The plot includes a horizontal line at $y = 1.3$. Genes are colored based on their $\log_{10}(\text{FC})$ values: blue for $\log_{10}(\text{FC}) < -1$, grey for $-1 \leq \log_{10}(\text{FC}) \leq 1$, and orange for $\log_{10}(\text{FC}) > 1$. Horizontal bars indicate the range of $\log_{10}(\text{FC})$ for groups of genes.

The figure is a scatter plot with the x-axis representing the number of nodes (ranging from 0 to 100) and the y-axis representing the number of edges (ranging from 0 to 100). A horizontal line is drawn at y=50. Three data series are plotted: Erdős-Rényi (blue 'x'), Barabási-Albert (orange 'x'), and Watts-Strogatz (grey 'x'). The Erdős-Rényi graph shows a dense cluster of points below the line, while the Barabási-Albert and Watts-Strogatz graphs show points more evenly distributed around the line.

55,679,878

The plot displays the results of a genome-wide association study (GWAS) on chromosome 7. The y-axis represents the negative logarithm of the p-value ($-\log_{10}(p\text{-value})$), and the x-axis represents the genomic position in megabases (Mb). A blue horizontal line indicates a significance threshold at approximately 13. Data points are colored blue and orange, with some points exceeding this threshold. Horizontal black bars are positioned above the blue line, highlighting specific genomic regions.
